

M5 Option B (RMSNormed tortuosity) — escapes the $\tau \approx 1$ geometric artifact

(a) M5 Option B: τ_B per context (linear scale)

(b) $\log_{10}(\tau_B)$ heatmap — context $\times$ layer

(c) τ_A (raw, ≈ 1) vs τ_B (RMSNormed, varies) shows why Option B is meaningful

(d) τ_B distribution at calibration layer $\ell=27$ per-context discrimination
